Supplemental Material

Supplemental Figure 1. Nomogram to calculate the relationship between unperformed cases, potential monthly case capacity above baseline, and months needed to clear backlog of cases. Formula: Monthly increase in volume of cases x desired number of months to clear unperformed cases = total number of unperformed cases that can be cleared. Example (red line): From 4/1/2020 to 10/1/2020 (6 months) we performed 55 colonoscopies per month when we typically perform 100 per month. We have a backlog of 270 colonoscopies. We can perform up to 130 colonoscopies per month, 30 beyond our typical 100. By connecting the 30 on the far-left line with 270 on the middle line using a straight edge, we calculate that it will take 9 months to clear the backlog.

Alternatively, we calculate that we have 270 unperformed colonoscopies. We want to clear these unperformed procedures within 9 months. By connecting the 9 on the far-right line with 270 on the middle line using a straight edge, we calculate that we need to increase our colonoscopy volume by 30 per month to address the backlog in the desired timeframe.
